Captain C.A.M.C.

The BOARD having assembled pursuant to order, proceed to

examine Dr. R.M. Coleman.

He states that when 11 years of age he had a fracture of the left femur (compound). There exists at present a definite shortening of six inches of the left leg, causing him to walk on the toes of the left foot and giving a decided limp to the gait. Movements at hip joint are absolutely normal. The knee joint is prominent on account of smallness of thigh and calf muscles. The tone of these muscles is excellent. The knee comes within an angle of 10 degrees of full extension and can be flexed normally. The movements at the ankle are pretty much limited to flexion and inversion of the foot.

There is atrophy and loss of function of the anterior tibial group and peroneal group of muscles. There is a callus under the transverse arch of the foot which gives him some trouble but is

amenable to care.

There is a small anaesthetic area on the postero-
inferior - lateral surface of the lower leg.

He has no other disabilities.
