Report of the Roentgen Examination of

Date. Nov. 5th.1918 Name Pte. J.M.Brown, #839016

Address. Park School.

Referred by Dr. Capt. Hearn. Case No. 38594.

Stereoscopic plates were made of the chest.

The bony contour is normal, and the heart and arch of the aorta are normal in size and position.

The hylus shadows are moderately heavy, more so on the right side.

The right upper vertebral truck is thickened and studded with minute fibrotic particles,

On the left side the upper vertebral trunk extends into the apex, and is also studded with minute nodules in the same manner as the right, The interlobar pleura on this side is plainly visible and fibrotic, and between the 5th and 7th. ribs in the mif-axillary line, the pleura is thickened and raised away from the chest wall, in a manner, which suggests a small previous pneumothorax at this point, which has not quite completely absorbed, It now covers an area of about 3 in. in diameter,

There is very definite pathology in this chest, and much evidence which strongly suggests a tuberculous process of mild degree, and not great in extent.
